SwimSignal

Check the water before you go

Five-day pollution risk forecasts for 105 swim spots in England, and for any river or lake you click on the map. How it works

Saturday: 19 of 105 spots at low risk

Lowest pollution risk this week: **today**

All spots

Updated Tue 06:39 · Pollution risk: 30 low · 25 moderate · 26 high or very high · 24 with no monitored overflow found upstream · 0 without a level. Today and tomorrow.

North East · 3 spots, 1 at low risk

River Allen, Plankey Mill
Low risk now · Moderate risk on Friday
River

River Coquet, Rothbury
Moderate risk right now: recent sewage spills · High risk on Saturday
River

1 more spot with no monitored overflow upstream
River Tees, Low Force

Cumbria and the Lake District · 25 spots, 15 at low risk

Coniston Water, Boating Centre
Moderate risk today: sewage spills
Lake · bathing water

Coniston Water, Brown Howe
Low risk for the next five days
Lake · bathing water

Coniston Water, Monk Coniston
Low risk for the next five days
Lake · bathing water

Derwent Water at Crow Park
High risk: rated poor
Lake · bathing water

Derwent Water, Calfclose Bay
Low risk now · Moderate risk on Saturday
Lake

Elter Water
Low risk now · Moderate risk on Friday
Lake

Grasmere (lake)
Low risk now · Moderate risk on Friday
Lake

River Eden, Armathwaite
High risk tomorrow: sewage spills
River

River Eden, Lazonby
Very high risk tomorrow: sewage spills
River

River Lune, Devil's Bridge, Kirkby Lonsdale
Low risk for the next five days
River

Rydal Water
Low risk for the next five days
Lake

Ullswater, Glenridding
Low risk for the next five days
Lake

Ullswater, near Sandwick
Low risk for the next five days
Lake

Ullswater, Pooley Bridge
Low risk for the next five days
Lake

Windermere, Fellfoot
Low risk for the next five days
Lake · bathing water

Windermere, Lakeside YMCA
Low risk for the next five days
Lake · bathing water

Windermere, Millerground Landing
Low risk for the next five days
Lake · bathing water

Windermere, Rayrigg Meadow
Low risk for the next five days
Lake · bathing water

Windermere, Waterhead, Ambleside
Low risk for the next five days
Lake

6 more spots with no monitored overflow upstream
Blea Tarn, Langdale, Buttermere, Crummock Water and 3 more

Yorkshire · 13 spots, 1 at low risk

Nidd at the Lido, Knaresborough
Very high risk tomorrow: sewage spills
River · bathing water

River Ribble, Stainforth Force
Moderate risk today: sewage spills
River

River Ure, Aysgarth Falls
Moderate risk tomorrow: sewage spills
River

River Wharfe, Appletreewick
High risk tomorrow: sewage spills
River

River Wharfe, Bolton Abbey (Cavendish Pavilion)
Moderate risk today: sewage spills · High risk on Saturday
River

River Wharfe, Burnsall
Moderate risk today: sewage spills · High risk on Friday
River

River Wharfe, Greenholme, Burley-in-Wharfedale
Very high risk right now: recent sewage spills
River

River Wharfe, Linton Falls, Grassington

Low risk now · Moderate risk on Thursday

River

Swale above Richmond Falls

High risk tomorrow: sewage spills

River · bathing water

Wharfe at Cromwheel, Ilkley

Very high risk tomorrow: sewage spills

River · bathing water

Wharfe at Wilderness Carpark

Very high risk right now: recent sewage spills

River · bathing water

2 more spots with no monitored overflow upstream

Janet's Foss, Gordale Beck, Malham and Semerwater

Lancashire · 2 spots, none at low risk

River Lune, Crook o' Lune, Caton

High risk tomorrow: sewage spills

River

River Ribble at Edisford Bridge

High risk: rated poor

River · bathing water

Peak District and Sheffield · 8 spots, none at low risk

River Dove, Dovedale stepping stones

Moderate risk tomorrow: sewage spills

River

River Wye, Chee Dale, Derbyshire

High risk tomorrow: sewage spills

River

6 more spots with no monitored overflow upstream

Burbage Brook, Padley Gorge, River Bradford, Bradford Dale, Youlgrave, River Dane, Panniers Pool, Three Shires Head and 3 more

Midlands · 3 spots, 2 at low risk

Rutland Water Sykes Lane
Low risk for the next five days
Lake · bathing water

Rutland Water Whitwell Creek
Low risk for the next five days
Lake · bathing water

1 more spot with no monitored overflow upstream
Colwick Country Park (West Lake)

Severn and the Welsh borders · 7 spots, none at low risk

River Severn at Ironbridge
High risk: rated poor
River · bathing water

River Severn in Shrewsbury
High risk: rated poor · Very high risk on Saturday
Overflows in Wales not counted (40% of the river above)
River · bathing water

River Teme in Ludlow
High risk: rated poor
Overflows in Wales not counted (12% of the river above)
River · bathing water

River Wye, Bishop's Meadow, Hereford
High risk today: sewage spills · Very high risk on Friday
Overflows in Wales not counted (29% of the river above)
River

River Wye, Symonds Yat
Moderate risk today: sewage spills · High risk on Friday
River

Sandy Lane, Chester
Moderate risk tomorrow: sewage spills
Overflows in Wales not counted (77% of the river above)
River · bathing water

1 more spot with no monitored overflow upstream
Hatchmere, Delamere

East of England · 8 spots, 1 at low risk

Falcon Meadow, River Waveney
Moderate risk tomorrow: sewage spills · High risk on Friday
River · bathing water

Friars Meadow, River Stour
Moderate risk right now: recent sewage spills · High risk on Friday
River · bathing water

River Cam, Grantchester Meadows
Moderate risk today: sewage spills
River

River Great Ouse, Houghton Mill
Moderate risk today: sewage spills
River

River Great Ouse, Overcote
Moderate risk today: sewage spills
River

River Stour, Dedham
Moderate risk right now: recent sewage spills
River

River Waveney, Outney Common, Bungay
Low risk now · Moderate risk on Friday
River

Sheep's Green, River Cam
High risk: rated poor
River · bathing water

Thames Valley · 11 spots, 3 at low risk

Pangbourne Meadow, River Thames
Low risk now · Moderate risk on Thursday
River · bathing water

River Thames, Buscot Weir
Moderate risk tomorrow: sewage spills · High risk on Saturday
River

River Thames, Clifton Hampden
Moderate risk today: sewage spills · High risk on Friday
River

River Thames, Henley-on-Thames
Low risk now · Moderate risk on Thursday
River

River Thames, Hurley
Low risk now · Moderate risk on Friday
River

River Thames, Lechlade
Moderate risk tomorrow: sewage spills · High risk on Saturday
River

River Thames, Long Bridges, Oxford
Moderate risk tomorrow: sewage spills · High risk on Saturday
River

River Thames, Port Meadow, Oxford
Moderate risk tomorrow: sewage spills · High risk on Saturday
River

Wallingford Beach, River Thames
Moderate risk tomorrow: sewage spills
River · bathing water

Wolvercote Mill Stream
High risk: rated poor
River · bathing water

1 more spot with no monitored overflow upstream
Cotswold Country Park and Beach

London · 5 spots, 1 at low risk

Ham and Kingston, River Thames
Low risk now · High risk on Saturday
River · bathing water

The Serpentine - Hyde Park
High risk: algae at the last check
Lake · bathing water · 8 mm of rain in 48 h

3 more spots with no monitored overflow upstream
Hampstead Heath (Ladies Pond), Hampstead Heath (Mens Pond) and Hampstead Heath (Mixed Pond)

South and South East · 8 spots, 4 at low risk

Frensham Great Pond
Low risk for the next five days
Lake · bathing water

River Avon at Fordingbridge
High risk: rated poor · Very high risk on Friday
River · bathing water

River Avon at Queen Elizabeth Gardens
Low risk now · Moderate risk on Saturday
River · bathing water

River Itchen, Compton Lock
Low risk now · Moderate risk on Friday
River

River Medway, Tonbridge
High risk right now: recent sewage spills · Very high risk on Saturday
River

River Ouse (Sussex), Barcombe Mills
Moderate risk tomorrow: sewage spills · Very high risk on Saturday
River

River Test, Chilbolton Cow Common
Low risk for the next five days
River

River Wey, Waverley, near Farnham
Moderate risk tomorrow: sewage spills · High risk on Friday
River

South West · 12 spots, 2 at low risk

River Avon, Warleigh Weir, Bath
Very high risk tomorrow: sewage spills
River

River Dart, Dartington Pontoon
High risk tomorrow: sewage spills · Very high risk on Thursday
River

River Dart, Sharrah Pool
Low risk now · High risk on Friday
River

River Dart, Spitchwick (Deeper Marsh)

Low risk now · Moderate risk on Thursday

River

River Frome at Farleigh Hungerford

High risk: rated poor · Very high risk on Thursday

River · bathing water

River Frome, Tellisford Weir

High risk today: sewage spills · Very high risk on Thursday

River

River Teign, Drogo Weir

Moderate risk right now: recent sewage spills · High risk on Thursday

River

River Teign, Fingle Bridge

Moderate risk right now: recent sewage spills · High risk on Thursday

River

River Tone at French Weir Park

High risk: rated poor · Very high risk on Thursday

River · bathing water

3 more spots with no monitored overflow upstream

Henleaze Lake, River Barle, Tarr Steps and River Plym, Cadover Bridge

105 spots.

Updated several times a day. What the levels mean.

For swimming and water sports. Forecasts, not water tests. Tools for clubs, centres and events.

About these forecasts

For each spot, SwimSignal traces the river upstream, finds every monitored storm overflow whose water reaches it, and combines what those overflows are doing now with how likely each is to spill over the next five days, allowing for travel time, bacterial die-off and dilution. It is a forecast, not a water test: "low risk" is not a guarantee of clean water, and inclusion of a spot is not a statement that it is safe to swim there. How accurate is it?

What the levels mean

A day's level is the highest of these. A spot's page shows each one.

Sewage spill risk

A 0–100 score for sewage from upstream reaching the spot. Low under 15, moderate 15 to 40, high 40 to 70, very high 70 or more.

Sewage spills right now

Today only: the overflows upstream discharging now, or stopped lately, from the water companies' live feeds. Today's level is at least right now's.

E. coli estimate

On rivers with overflows upstream: the chance a water sample would show E. coli over 900 per 100 ml, from any source, runoff after rain included. Low risk under 10%, moderate 10 to 25%, high 25 to 50%, very high over 50%. The minimum bathing-water standard lets about one sample in ten be over 900. It is tested only for May to September, so it sets the level only then: from October to April, when the EA takes no samples, it is shown marked † but does not set the level. A spot's page says how it has done on live samples so far.

Environment Agency rating

At a designated bathing water, the EA's yearly rating from up to four seasons of lab samples. When it is poor, advice against bathing applies through the bathing season, 15 May to 30 September, and the level is at least high risk on every day. Where there is no daily forecast, a rating of sufficient makes the level moderate risk and poor makes it high risk; excellent or good leave the plain level below.

Algae

At a designated bathing water, the EA sampler's last look, if under two weeks old: enough algae to be objectionable makes the level at least high risk, some at intervals at least moderate risk.

Lab sample

At a designated bathing water, the EA's latest sample, if under two weeks old and over 900 E. coli per 100 ml: the level is at least moderate risk.

Not included

The EA's short-term advice against bathing after a pollution incident or an algal bloom: SwimSignal cannot read it, so a bathing water's page says it could not be checked. Opening "Today's EA advice" there loads the EA's own panel, which has it. Nor the overflows in Wales, which are not in the data: where a spot's river runs from Wales, its page says how much of it is in Wales.

Low

Nothing in the forecasts or the EA's rating flags the day. That is not a guarantee of clean water, and it says nothing about currents, cold water or algae.

Moderate

Some chance that sewage reaches the spot, or that a water sample would be over 900 E. coli per 100 ml.

High

Sewage reaching the spot, or a sample over 900, is a real prospect; or the EA rates the water poor.

Very high

Sewage reaching the spot, or a sample over 900, is likely.

No monitored overflow found upstream

The trace found no monitored storm overflow within 60 km upstream, or the river network draws no river into the lake, so there is no sewage spill risk and no E. coli estimate. That is not the same as no risk. Other risks apply: algae,

wildlife, runoff and bathers. Check the signs at the water. Where a rating of sufficient or poor, algae at the last check or a recent sample raises the level, that sets it instead.

No level

No forecast in this update, or no river or lake on the network near the spot. There is nothing to go by, which is not the same as clean water.

Under its level, a spot's page says in one line what to do, from published health advice for swimmers. Each line and its sources.

What each part of a spot's page means

Right now

Which upstream storm overflows are discharging now or stopped lately, from the water companies' live feeds. A spill counts in full from its start until its water has passed the spot, then for less over the next 48 hours. Today's level is at least right now's. A spill reported running for over two days is named as possibly a monitor fault, and still counts.

Sewage spill risk (0–100)

A 0–100 score for sewage from upstream reaching the spot. It is built from the chance that at least one overflow upstream spills and its discharge arrives, after travel time, die-off and dilution. The spill part is verified against what the overflows did; the die-off and dilution weights are physical estimates, not calibrated against water samples, so the score is not a probability. The colour levels (low to very high) come from it.

E. coli estimate

The estimated chance that a midday water sample would show over 900 E. coli per 100 ml, from rainfall at the spot, the sewage spill risk, water-body type and season, fitted to Environment Agency samples at river and lake bathing waters and tested on years and sites it never saw. It counts bacteria from any source, so rain alone can raise it when the sewage spill risk is low. 900 is the threshold used in the inland "sufficient" classification, which is a 90th-percentile calculation over four seasons, not a pass/fail test of one sample. It is validated on rivers in the May–September sampling season only; on lakes it has no demonstrated skill and is not shown. The EA takes no samples from October to April, so then nothing tests it: the figure is still shown, marked †, but it does not set the level, and the date's own effect is held at its value at the nearer end of the season (30 September or 1 May) rather than carried on with nothing to check it. A spot's page says how it has done on the samples taken since the forecast began, and, where the river runs from Wales, what a test on Welsh river samples found.

Algae

Designated bathing waters only: the Environment Agency sampler's latest look at the water, an observation, not a forecast. It does not tell blue-green algae from harmless kinds.

Water temperature

Rivers only, where an Environment Agency sensor on the same river, within 15 km in a straight line and on the same side of the tidal limit, has reported in the last day: its latest reading, with how far up or down the river it is and how old the reading is. Where there is no such sensor nothing is shown; the temperature is never estimated. It is not part of the level.

What it does not know

The treated sewage that sewage works let out every day, and anything about a specific farm, road, outfall or algal bloom: only monitored storm overflows are modelled. Nor does it use the wind, which decides where river water

goes in a lake. What the forecast does not count, and what you can do.
